

Acknowledgment

We would like to express our sincere thanks and gratitude to our guide **Mr. Yogesh B Patil** for his valuable guidance and suggestions. We are highly indebted to him for providing us an excellent opportunity to learn and present our studies in the form of this project report.

We take this opportunity to thank the members of the teaching and non-teaching staff of Shaheed Bhagat Singh State Technical Campus for the timely help extended by them. Lastly thanking our parents for their morale support and encouragement

Abstract

The proposed project is HTML based Web development (BLOG). This project provides a platform for individuals or organization to share information, thoughts, or experiences with a wider audience, fostering engagement, building a community, and potentially promoting products or services.

Blogs can serve as a space for individuals to express their thoughts, opinions, and experiences, or to share hobbies and interests. This project can help to share similar thoughts which may perform same sense of community. Blogs share by expertise can improve our knowledge on a specific topic, and can also become a resource for others.

This project has one of the main uses is that we can share daily news of industries and other. So, it become a platform for business to engage with their audience, respond to questions, and build relationships.

1 Introduction

1.1 *Project Definition:*

A blog (a **blend** of the term web log) is a type of **website** or part of a website, which is the publication of regular articles over time in some area of personal or professional interest. Blogs are usually maintained by an individual with regular entries of commentary, descriptions of events, or other material such as graphics or video. Blog can also be used as a verb, meaning to maintain or add content to a blog.

There are many different types of blogs, differing not only in the type of content, but also in the way that content is delivered or written

The software for writing blogs can be divided into user hosted (software application installed by web log authors to run on their own system) and developer hosted (software services operated by the developer, requiring no software installation for the blog author.)

Developer-hosted service are Blogger.

1.2 *Project Scope:*

The scope of our project is to vastly expand the following field

Personal blogs

The personal blog, an ongoing diary or commentary by an individual, is the traditional, most common blog. Personal bloggers usually take pride in their blog posts, even if their blog is never read. Blogs often become more than a way to just communicate; they become a way to reflect on life, or works of art. Blogging can have a sentimental quality. Few personal blogs rise to fame and the mainstream but some personal blogs quickly garner an extensive following. One type of personal blog, referred to as a microblog, is extremely detailed and seeks to capture a moment in time. Some sites, such as Twitter, allow bloggers to share thoughts and feelings instantaneously with friends and family. and are much faster than emailing or writing.

Corporate and organizational blogs

A blog can be private, as in most cases, or it can be for business purposes. Blogs used internally to enhance the communication and culture in a corporation or externally for marketing, branding or public relations purposes are called corporate blogs. Similar blogs for clubs and societies are called club blogs, group blogs, or by similar names; typical use is to inform members and other interested parties of club and member activities.

By genre

Some blogs focus on a particular subject, such as political blogs, travel blogs (also known as travelogues), house blogs, fashion blogs, project blogs, education blogs, niche blogs, classical music blogs, quizzing blogs and legal blogs (often referred to as a blows) ordeals. Two common types of genre blogs are art blogs and music blogs. A blog featuring discussions especially about home and family is not uncommonly called a mom blog. While not a legitimate type of blog, one used for the sole purpose of spamming is known as a Slog.

By media type

A blog comprising videos is called a vlog, one comprising links is called a link log, a site containing a portfolio of sketches is called a sketch blog or one comprising photos is called a photoblog. Blogs with shorter posts and mixed media types are called tumblelogs. Blogs that are written on typewriters and then scanned are called typecast or typecast blogs; see typecasting (blogging).

A rare type of blog hosted on the Gopher Protocol is known as a Phlox.

Science

A means of spreading data or discussing activities or results.

Social

Used to maintain social networks between people.

Consumer-generated advertising in blogs

Consumer-generated advertising is a relatively new and controversial development and it has created a new model of marketing communication from businesses to consumers. Among the various forms of advertising on blog, the most controversial are the sponsored posts. These are blog entries or posts and may be in the form of feedbacks, reviews, opinion, videos, etc. & usually contain a link back to the desired site using a keyword/s

Many blogs provide commentary or news on a particular subject, others function as more personal online diaries. A typical blog combines text, images, and links to other blogs, Web pages, and other media related to its topic. The ability of readers to leave comments in an interactive format is an important part of many blogs. Most blogs are primarily textual, although some focus on art (art blog), videos (video blogging), music (MP3 blog), and audio (podcasting). Micro blogging is another type of blogging, featuring very short posts.

1.3 Project Objective:

- Provide Tips and Tricks related to computers
- Provide Gaming news and Articles
- Android and iOS news and apps
- Target Audience: Provide latest news to our audience and readers
- Significance: User Friendly language and screenshots to provide interaction.

The objective of our Project is to provide all information and news related to latest gaming, computer tips & tricks and Android & IOS application on a website.

1.4 Technology and Literature Overview:

Tools and Technology

- Operating System: Windows 7/Windows 8/ Linux
- User Interface Design: HTML, JavaScript
- Web Browser: Mozilla, Google Chrome, Internet Explorer

Hardware

- Processor: Pentium AMD or Higher Version.
- RAM: 256MB
- Hardware Device: Keyboard with mouse
- Hardware Disk: Only space used by browser
- Display: Standard Output Display

2 | Project Management

2.1 Project Planning:

The objectives of project planning are to provide a SMART:

S: -Specific

M: -Measurable

A: -Action-driven

R: -Realistic

T: -time-bound framework that enables the reader to make reasonable scheduling.

These estimates are made within a limited time frame at the beginning of project and should be updated regularly as the project progresses.

There are many issues in the software planning as follows

SOFTWARE SCOPE

The first activity in the project planning is the determination of software scope. Function and performance allocated to software during system engineering should be assessed to establish a project scope that is unambiguous and understandable at the management and technical levels.

Software scope describes the data and control to be processed, function, performance, constraints, interfaces, and reliability. Functions described in the statement.

The availability of historical information has a strong influence on estimation risk. By looking back, we can emulate things that worked and improve areas where problems arose.

When comprehensive software metrics are available for past projects, estimates can be made with greater assurance, schedules can be established to avoid past difficulties, and overall risk is reduced.

Defining the software scope for this project we have to collect information from the company networking person by asking some questions. These questions include like from which server, how many clients, solutions to connect client to server etc.

2.2 Project Management:

Basic Principal

Project management is the process by which a proposed project is developed within a rigorous framework.

The process by which the various activities that need to be undertaken during a project's lifetime should be scheduled.

There are a range of activity management tools that are commercially available.

Project scheduling is an activity that distributes estimated effort across the planned project duration by allocating the effort to specific tasks.

2.3 Project Scheduling:

Project scheduling is concerned with the techniques that can be employed to manage the activities that need to be undertaken during the development of a project. Scheduling is carried out in advance of the project commencing and involves:

- identifying the tasks that need to be carried out;
- estimating how long they will take;
- allocating resources (mainly personnel):
- scheduling when the tasks will occur.

Once the project is underway control needs to be exerted to ensure that the plan continues to represent the best prediction of what will occur in the future:

- based on what occurs during the development;
- often necessitates revision of the plan.

Effective project planning will help to ensure that the systems are delivered:

- within cost;
- within the time constraint;
- to a specific standard of quality.

Proper scheduling requires

- Effort and timing are intelligently allocated to each task.
- Interdependencies between tasks are properly indicated.
- Resources are allocated for the work to be done.

3 System Analysis & Requirements

3.1 Feasibility Study:

Time Schedule Feasibility

- The estimated time duration based on the complexity of the project requires about 5 months.
- The organization and The University allow us to develop our project work within the specified time duration.

3.2 Functional Requirements

User Requirement

Any web user can use this website.

3.3 Hardware and Software Requirements

These requirements are described below.

We have Include hardware and software interfaces.

Software Requirements:

- Technology: Python Django
- IDE: PyCharm/Atom
- Client-Side Technologies: HTML, CSS, JavaScript, Bootstrap
- Server-Side Technologies: Python
- Data Base Server: SQLite
- Operating System: Microsoft Windows/Linux

Hardware Requirements:

- Processor: Pentium-III (or) Higher
- Ram: 64MB (or) Higher
- Hard disk: 80GB (or) Higher

3.4 Features of New System:

Tips for the visitors.

Online comments.

Mailing system and Social network connectivity for the users who are seeking information.

Optimized search for all users about any Blog.

Simple and effective service to all its user in very less amount of time.

3.5 Non-Functional Requirements:

Non-functional requirements are the requirements for a system that describe how the system should behave, rather than what the system should do. For an online loan management system, some examples of non-functional requirements could include:

- **Security:** The system should have appropriate security measures in place to protect sensitive user information and prevent unauthorized access to the system.
- **Accessibility:** The system should be accessible to users with disabilities, such as those with visual or auditory impairments.
- **Performance:** The system should be able to handle a high volume of transactions without significant delays or downtime.
- **Scalability:** The system should be able to easily scale up or down to accommodate changes in user demand.
- **Usability:** The system should be easy for users to navigate and use, with a user-friendly interface and clear instructions for completing tasks.
- **Reliability:** The system should be reliable, with a high uptime and minimal downtime for maintenance.

4 Implementation

4.1 Implementation Issues

HTML -

HTML (Hypertext Mark-up Language) is the standard mark-up language used to create web pages. It is a structured language that allows developers to define the structure of content on a webpage using tags, attributes, and elements. HTML provides a way for web browsers to interpret and display content in a structured and organized manner.

CSS –

CSS (Cascading Style Sheets) is a style sheet language used for describing the presentation of a document written in HTML. It enables developers to separate the structure of a webpage from its presentation. CSS allows developers to define the visual appearance of a webpage, such as font styles, colours, and layout.

JavaScript –

JavaScript is a high-level, interpreted programming language used to create interactive web pages. It is a client-side scripting language that allows developers to add dynamic elements and behaviour to web pages. JavaScript can manipulate HTML and CSS in real-time, making web pages more responsive and engaging.

Bootstrap –

Bootstrap is a free and open-source CSS framework that is widely used to create responsive and mobile-first web pages. It provides pre-built CSS styles and JavaScript plugins that developers can use to create professional-looking web pages quickly and easily. Bootstrap is compatible with all modern web browsers and devices

Python -

Python is a high-level, general-purpose programming language used to create a wide range of applications. It is a popular language for web development, scientific computing, data analysis, artificial intelligence, and many other areas. Python is known for its simplicity, readability, and easy-to-learn syntax.

Django -

Django is a free and open-source web framework written in Python. It follows the model-view-controller (MVC) architectural pattern and is designed to help developers build web applications quickly and easily. Django provides a number of built-in features, such as an object-relational mapper (ORM), automatic admin interface, and URL routing, that simplify web application development.

SQLite -

SQLite is a lightweight, serverless, and self-contained relational database management system. It is widely used in web applications and mobile apps, as it requires minimal configuration and administration. SQLite is compatible with all major programming languages and provides a simple and efficient way to store and retrieve data.

4.2 Coding Implementation

At this stage, I will begin coding as per the design specification(s). The output of this step is one or more product components built according to a pre-defined coding standard and debugged. tested and integrated to satisfy the system architecture requirement.

4.3 system Module

The modules involved in this project are

1. User

2. Admin

In this module:

- User can sign up.
- User can login
- User can upload multiple images
- User can choose images from database
- User can add information
- User can add comments
- User can select any categories

Admin In this module:

- Admin can block user id
- Admin can resume user id
- Admin can see all pages
- Admin can maintain all records of user
- Admin can maintain all site
- Admin can access and process all requests
- Admin can delete/update/select user.
- Admin Provide all information related to any topic

4.1 Change Account Information: -

Update Account information like Name, Address, Email ID and their detail.

4.2 Search Reference Case: -

System will provide an interface for Administrator & Subordinate searching comprehensively the reference information from the blogs of application on the basis of various parameters, like Title of blogs e.g. health.

5 System Design

Contents:

- 1) Use case diagram
- 2) Activity Diagram
- 3) Data flow diagram

5.1 Use Case Diagram:

- Use case diagram consists of use cases and actors and shows the interaction between them. The key points are:
- The main purpose is to show the interaction between the use cases and the actor.
- To represent the system requirement from user's perspective.
- The use cases are the functions that are to be performed in the module.

5.2 Activity Diagram:

Future Enhancements

Future enhancement means that the scope in the future of the system.

Try to make as more user friendly as possible. we would like to develop it for our earning purpose and also give it a domain name

Conclusion

Finally, in the online Blog System, the outcome of all the hard work done for the HTML based Web development (BLOG) is here. It is a software or website the helps the user to post and read different thought of different peoples.

As we know Blog is a social site which is very much useful in today's world. We provide as many features as we can make the site viable and useful and also website is very easy to use for all users.

Our proposed website is online and real time based on internet, which is very much ahead to go so user will like to use it.
